

CLAIMS

What is claimed is:

- 1 1. A method of improving the interface between a dielectric and a semiconductor
2 material comprising the steps of:
3 preparing a passivated semiconductor surface using a valance-mending agent;
4 depositing a precursor to a dielectric on the valence-mended semiconductor surface;
5 and
6 oxidizing the precursor to a dielectric, wherein depositing and oxidizing do not
7 damage the valence-mended semiconductor surface.
- 1 2. The method of claim 1, wherein the precursor to a dielectric is a metal selected
2 from the group of metals whose oxide is a dielectric.
- 1 3. The method of claim 1, wherein oxidizing is in an oxygen-containing ambient.
- 1 4. The method of claim 1, wherein the oxygen-containing ambient is selected
2 from the group consisting of pure oxygen, an oxygen and hydrogen mixture, water vapor, an
3 oxygen and nitrogen mixture, nitric oxide, nitrous oxide, ozone and combinations thereof.
- 1 5. The method of claim 1, wherein the semiconductor surface is selected from the
2 group consisting of silicon, germanium, silicon-germanium and silicon-carbide.
- 1 6. The method of claim 1, wherein depositing is by evaporation selected from the
2 group consisting of thermal evaporation and electron-beam evaporation.
- 1 7. The method of claim 1, wherein oxidizing is from a few seconds to a few
2 hours.
- 1 8. The method of claim 1, wherein oxidizing uses a pressure from a few milli-
2 Torr to atmospheric pressure.
- 1 9. The method of claim 1, wherein the passivating agent is selected from the
2 group consisting of Group V, VI, or VII congener, or hydrogen.

1 10. The method of claim 1, wherein the valence-mended semiconductor surface is
2 one atomic layer thick.

1 11. The method of claim 1, wherein during oxidizing the valence-mended
2 semiconductor surface is at a temperature selected from room temperature to 800 degrees
3 Centigrade, and any temperature in between.

1 12. The method of claim 1, wherein during depositing the valence-mended
2 semiconductor surface is at a temperature selected from room temperature to 500 degrees
3 Centigrade, and any temperature in between.

1 13. The method of claim 1, wherein the method significantly improves the
2 capacitance-voltage characteristics of the interface between the dielectric and the valence-
3 mended semiconductor surface.

1 14. A method of improving the interface between a high-k dielectric and a silicon
2 (100) surface comprising the steps of:

3 passivating the silicon (100) surface using a Group VI element and hydrogen;
4 depositing a film of metal on the silicon (100) surface; and
5 oxidizing the metal film to convert the metal film to a metal oxide film with a
6 dielectric constant larger than 4.

1 15. The method of claim 14, wherein oxidizing is in an oxygen-containing
2 ambient selected from the group consisting of pure oxygen, an oxygen and hydrogen mixture,
3 water vapor, an oxygen and nitrogen mixture, nitric oxide, nitrous oxide, ozone and
4 combinations thereof.

1 16. The method of claim 14, wherein depositing and oxidizing do not damage the
2 passivated silicon (100) surface.

1 17. The method of claim 14, wherein depositing is by evaporation selected from
2 the group consisting of thermal evaporation and electron-beam evaporation.

1 18. The method of claim 14, wherein oxidizing is from a few seconds to a few
2 hours.

1 19. The method of claim 14, wherein oxidizing uses a pressure from a few milli-
2 Torr to atmospheric pressure.

1 20. The method of claim 14, wherein passivating results in a valence-mended
2 silicon surface of one atomic layer thick.

1 21. A method of improving the interface between a dielectric and a silicon-
2 germanium (100) surface comprising the steps of:

3 passivating the silicon-germanium (100) surface using a Group VI element and
4 hydrogen;

5 depositing a film of metal on the silicon-germanium (100) surface; and

6 oxidizing the metal film to convert the metal film to a metal oxide film which is a
7 dielectric.

1 22. The method of claim 21, wherein oxidizing is in an oxygen-containing
2 ambient selected from the group consisting of pure oxygen, an oxygen and hydrogen mixture,
3 water vapor, an oxygen and nitrogen mixture, nitric oxide, nitrous oxide, ozone and
4 combinations thereof.

1 23. The method of claim 21, wherein depositing and oxidizing do not damage the
2 passivated silicon-germanium (100) surface.

1 24. The method of claim 21, wherein depositing is by evaporation selected from
2 the group consisting of thermal evaporation and electron-beam evaporation.

1 25. The method of claim 21, wherein oxidizing is from a few seconds to a few
2 hours.

1 26. The method of claim 21, wherein oxidizing uses a pressure from a few milli-
2 Torr to atmospheric pressure.

1 27. The method of claim 21, wherein passivating results in a valence-mended
2 silicon-germanium surface of one atomic layer thick.

1 28. A semiconductor/dielectric interface with improved capacitance-voltage
2 characteristics comprising:

3 a semiconductor substrate having at least one surface with one atomic layer of
4 valence-mending atoms; and

5 a metal film deposited on the semiconductor substrate.

1 29. The semiconductor/dielectric interface of claim 28, wherein the valence-
2 mending atoms were applied upon passivating the semiconductor substrate with an element
3 selected from the group consisting of Group V, VI or VII elements, or hydrogen.

1 30. The semiconductor/dielectric interface of claim 28, wherein the semiconductor
2 substrate is selected from the group consisting of silicon, germanium, silicon-germanium and
3 silicon-carbide.

1 31. The semiconductor/dielectric interface of claim 28, wherein the metal film is
2 oxidized to form a metal oxide dielectric film.
